

RECTIFICATION TECHNOLOGY

Distillation columns are used when a great number of theoretical stages are required, meaning that when the products to be separated are close in terms of boiling point.

Distillation columns are used when a great number of theoretical stages are required, meaning that when the products to be separated are close in terms of boiling point. Our company has ample experience in the calculation of theoretical stages (for mixtures), optimal reflux flow rate and pressure drop within the equipment. We have developed our own in-house process simulation software to calculate the right size of the equipment involved in the distillation.

The stream can enter at the top, center or bottom of the column.

ADVANTAGES

- Suitable equipment when high purity of compounds is required.
- The ability to work in continuous or batch way.
- Very well known in the chemical/oil industry.
