

Helium Leak Testing Systems

d.

Experts in design and production of Vacuum Equipment

High Productivity and reliability (designed for 24/7 operation)

High Sensitvity (down to 10-8 mbar l / s range)

Optimized operational costs (energy consumption / maintenance)

Automated toolings

Telstar

Helium Leak Testing Systems

Telstar Helium Leak Testing systems are based on more than 60 years experience in design and production of Vacuum Equipment. Our technical expertise and flexibility allowed us to provide solutions to the most demanding applications in terms of maximum allowable leak and cycle time.

The standard method consists in placing the part under test inside a vacuum chamber and pressurizing the part with Helium. A specially designed mass spectrometer detects the Helium in the chamber if the part under test is leaking.

Other tests can be done when required: presure decay test, flow test, filling the part with special gases after the test, ...

Simplified Helium Leak Detection Schematic

Why Helium?

Helium is chosen as the tracer gas for several reasons:

- Non poisonous.
- Non combustible.
- Non explosive.
- Non condensable in the range of application.
- Thermally stable.
- Inert.
- Very low background (only 5ppm in air)
- Second smallest gas particle after hydrogen.
- Clearly separable in the mass spectrometry.
- Reasonably cost effective.

Industrial Applications

Ensuring the integrity of manufactured parts has become essential in many industrial processes today. Helium Leak Testing is proven as the only reliable leak detection method when trying to find very small leaks below 10^{-4} mbar $\cdot 1 / s$.

Additionally, Helium Testing is the method of choice when extremely fast cycle times are required or when complete automation is needed because human mistake is not acceptable.

Double Chamber Helium Leak Testing System

Automatic Loading and Unloading System

Integral Test

Our Helium Leak Testers perform what is known as integral test. The test is able to distinguish between a correct (tight) and an incorrect (leaking) part, irrespectively the leak or leaks location. The main advantages are:

- User independent method
- Overall leak rate is measured, avoiding multiple individual leaks which are correct one by one but faulty when their effects are added up.

If the part needs to be recovered for corrective action, the exact location of the leak can be found by using an optional sniffer probe module or an independent portable leak detector.

Single Chamber Helium Leak Testing System

| Industry | Typical Maximum Allowable Leak | Typical Cycle Time |
|--|-----------------------------------|-----------------------|
| Automotive: • A/C Hoses • Heat Exchangers • Condensers • Evaporators • Fuel Tanks • Diesel Pumps • Aluminum wheel rims | 10-5–10-6 mbar • I/s | 20s - 60s |
| EnergySF6 isolated switchgearsVacuum Tubes | 10-6–10-8 mbar • I/s | 5 -10 minutes |
| Refrigeration • Evaporators • Condensers • Hermetic compressors | 10-5_10-6 mbar • l/s | 20s |
| Others: • Instrumentation • Drums • Fire Extinguishers | | |

Our advantages

Compact and ergonomic System, minimizing footprint while keeping complete access to the components for maintenance. **Productivity**, optimized cycle time, single or multiple chamber configuration.

Precision, down to 10-8 mbar•l / s maximum allowable leak.

Automation, door opening and closing, part loading and unloading, automatic bar code reader and printer.

Reliable test, operator independent, automatic verification and calibration.

Flexibility, small and automated configuration adapted to customer's needs, from small valves to bulky high voltage switchgears.

- 1. Vacuum Test Chamber
- 2. Double Test Chamber (optional)
- 3. Leak Detector
- 4. Calibrated Leak
- 5. Vacuum Chamber Pumpset
- 6. Interseal Vacuum Pump
- 7. Gas Management System
- 8. Part Pumpset
- 9. Helium Recovery Pumpset (optional)
- 10. Helium Economizer (optional)
- 11. Helium Recovery System (optional)
- 12. Control System
- 13. Remote control (optional)

Control System

Our machines are controlled by state of the art PLC especially configured to comply with customer's process requirements. The PLC allows automatic operation including visual and audio signs, alarms, emergency buttons and automatic data storage. It also allows manual control of the system and modification of process parameters and recopies through the touch screen and LeakStar user's interface.

LeakStar®

Our supervision and control software LeakStar® is simple, accurate and easy-to-use. It enables inspection of the whole working cycle through a touch screen panel.

Main screen displays many important parameters as cycle status, test result, chamber pressure, and other customized variables as percentage of good parts during the run. Additionally, the operator can navigate through a series of screens (password protected) to perform different actions as launch a calibration, access counters and maintenance schedule, modify or select recipes, generate reports and others.

HeliStar®

SCADA system is an application running on a personal computer that provides control, supervision and data acquisition over all variables and parameters involved in the operation. The system also allows a high level of traceability of the process through the saved data.

Helium Recovery

Helium costs are increasing rapidly and its recovery is becoming more and more interesting.

Telstar Helium Recovery System consists on a Helium compressor plus a low pressure storage flexible volume and a high pressure storage vessel. The system can be complemented with a Helium concentration monitor, to measure the purity of the gas and a dryer that removes any moisture the gas can collect.

Telstar Helium Recovery Systems are very efficient (higher than 95% He recovery rate).

Helium Economizer

If your He consumption does not justify the acquisition of a recovery system, Telstar offers an intermediate solution: the 'Helium economizer'. Please contact us for additional details.
